TABLE 5.1Some Substances Found as Gases at 1 atm and 25°C

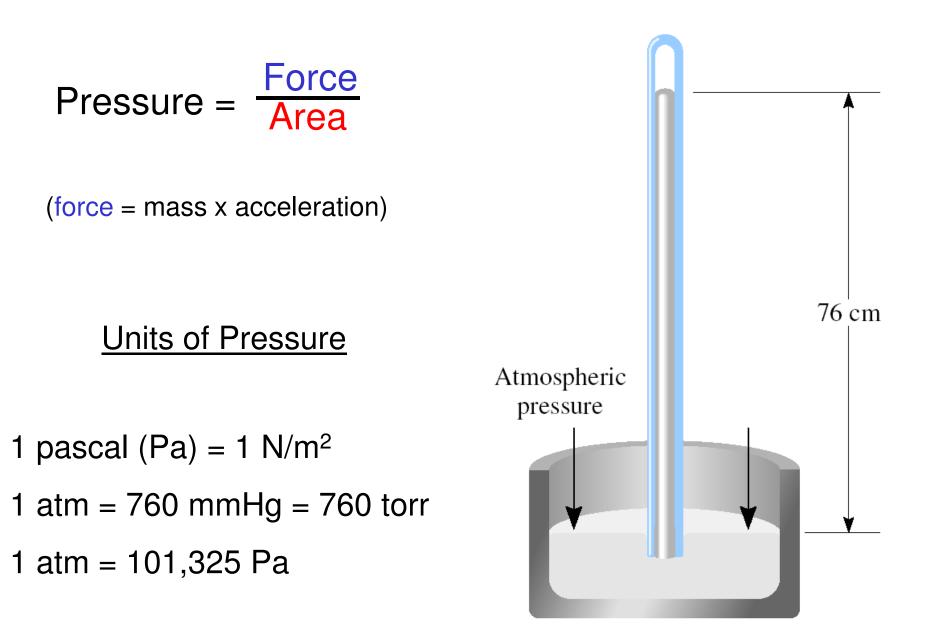

Elements	Compounds			
H ₂ (molecular hydrogen)	HF (hydrogen fluoride)			
N ₂ (molecular nitrogen)	HCl (hydrogen chloride)			
O ₂ (molecular oxygen)	HBr (hydrogen bromide)			
O ₃ (ozone)	HI (hydrogen iodide)			
F ₂ (molecular fluorine)	CO (carbon monoxide)			
Cl ₂ (molecular chlorine)	CO ₂ (carbon dioxide)			
He (helium)	NH ₃ (ammonia)			
Ne (neon)	NO (nitric oxide)			
Ar (argon)	NO ₂ (nitrogen dioxide)			
Kr (krypton)	N ₂ O (nitrous oxide)			
Xe (xenon)	SO ₂ (sulfur dioxide)			
Rn (radon)	H ₂ S (hydrogen sulfide)			
	HCN (hydrogen cyanide)*			

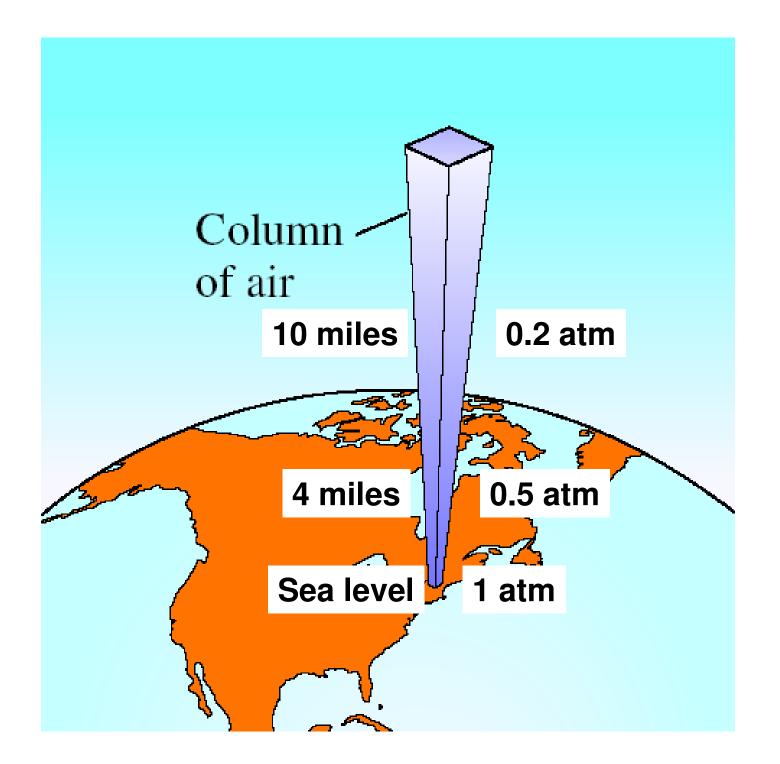

*The boiling point of HCN is 26°C, but it is close enough to qualify as a gas at ordinary atmospheric conditions.

Physical Characteristics of Gases

- Gases assume the volume and shape of their containers.
- Gases are the most compressible state of matter.
- Gases will mix evenly and completely when confined to the same container.
- Gases have much lower densities than liquids and solids.

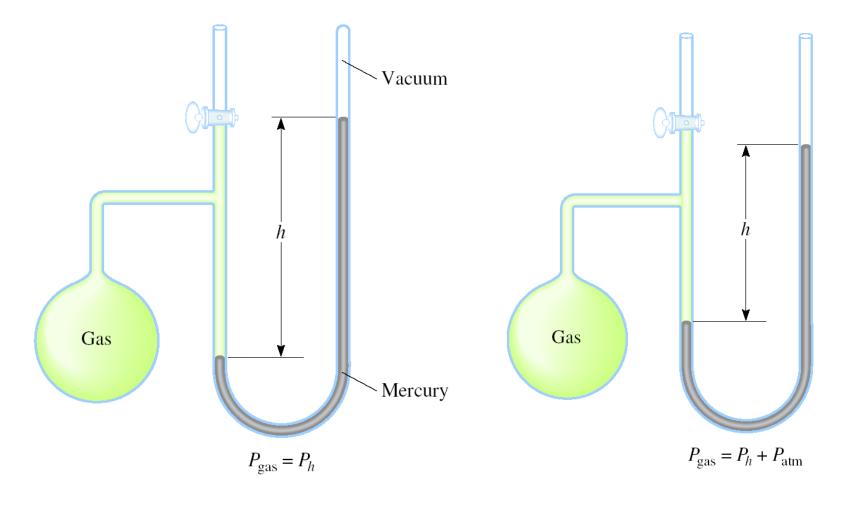

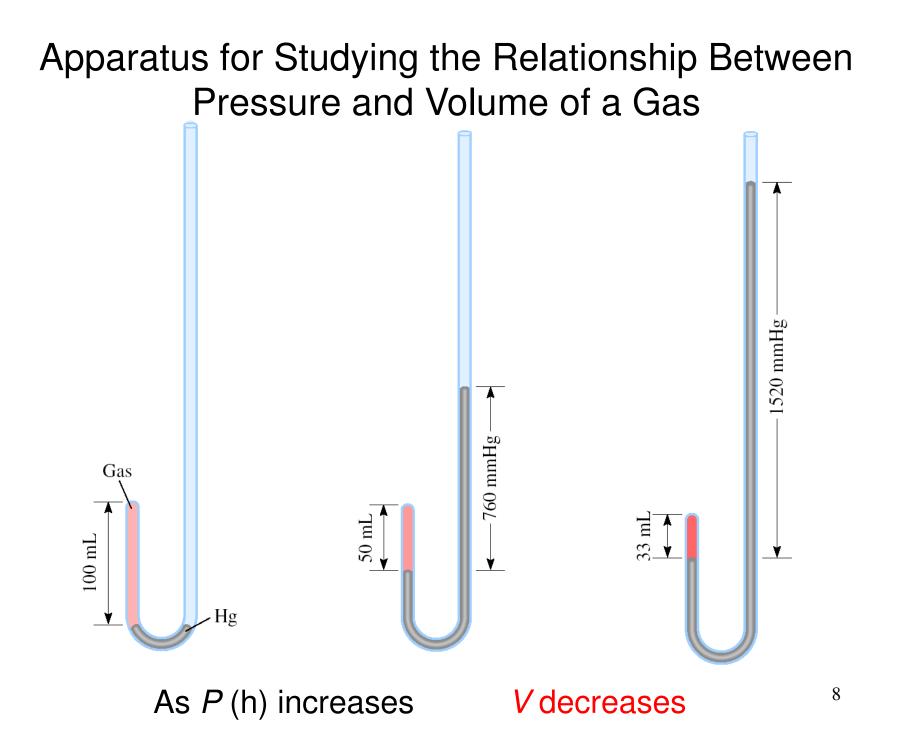

Manometers Used to Measure Gas Pressures

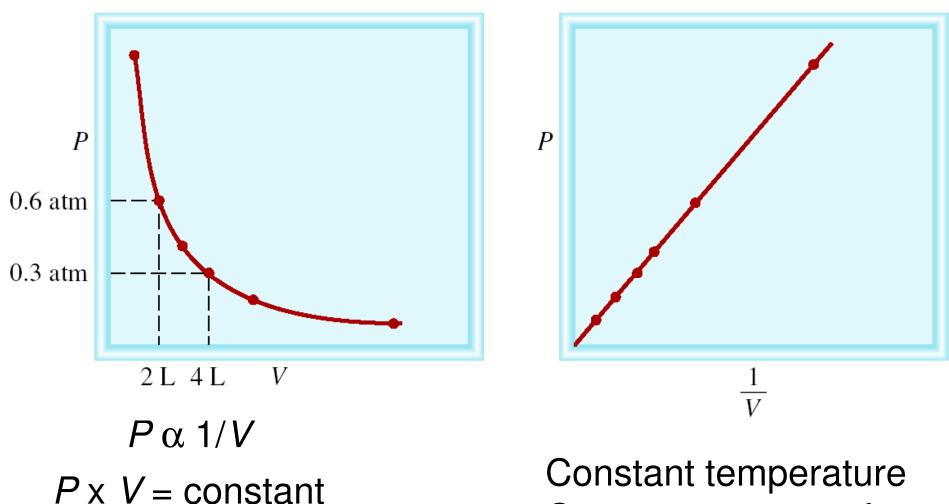

closed-tube

open-tube

Boyle's Law

$$P_1 \times V_1 = P_2 \times V_2$$

Constant amount of gas

A sample of chlorine gas occupies a volume of 946 mL at a pressure of 726 mmHg. What is the pressure of the gas (in mmHg) if the volume is reduced at constant temperature to 154 mL?

$$P \times V = constant$$

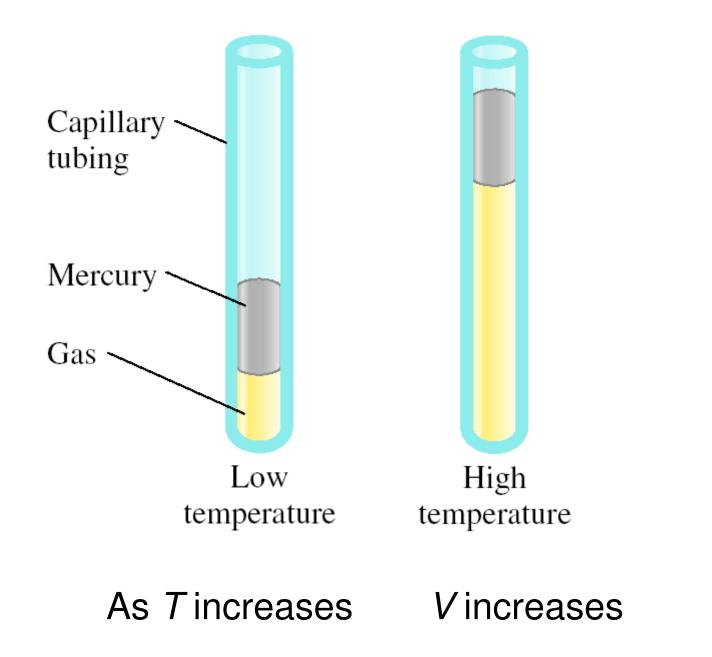

$$P_1 \times V_1 = P_2 \times V_2$$

$$P_1 = 726 \text{ mmHg} \qquad P_2 = ?$$

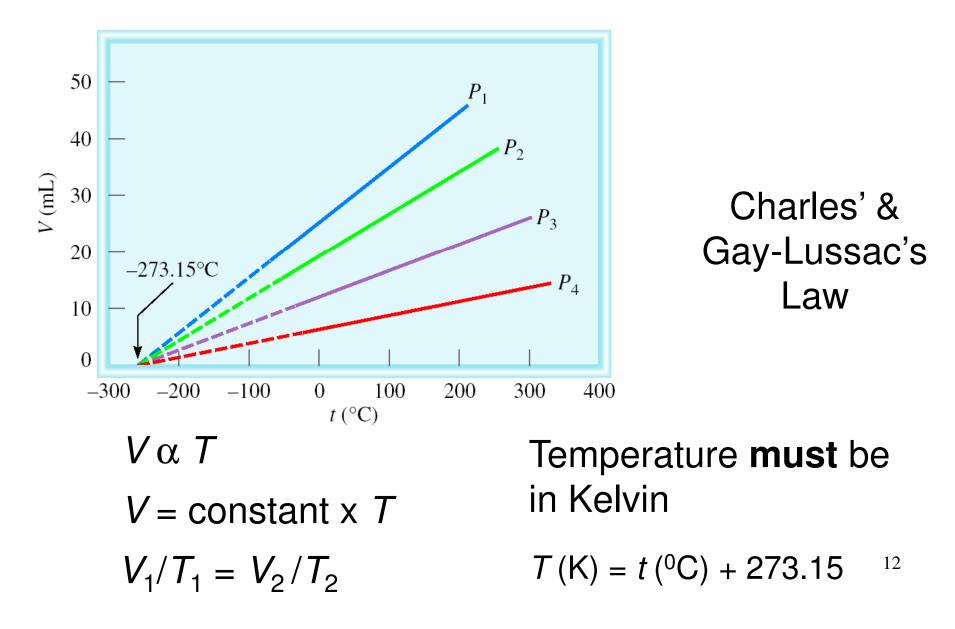

$$V_1 = 946 \text{ mL} \qquad V_2 = 154 \text{ mL}$$

$$P_2 = \frac{P_1 \times V_1}{V_2} = \frac{726 \text{ mmHg} \times 946 \text{ mL}}{154 \text{ mL}} = 4460 \text{ mmHg}$$

Variation in Gas Volume with Temperature at Constant Pressure

Variation of Gas Volume with Temperature at Constant Pressure

A sample of carbon monoxide gas occupies 3.20 L at 125 °C. At what temperature will the gas occupy a volume of 1.54 L if the pressure remains constant?

$$V_{1}/T_{1} = V_{2}/T_{2}$$

$$V_{1} = 3.20 \text{ L} \qquad V_{2} = 1.54 \text{ L}$$

$$T_{1} = 398.15 \text{ K} \qquad T_{2} = ?$$

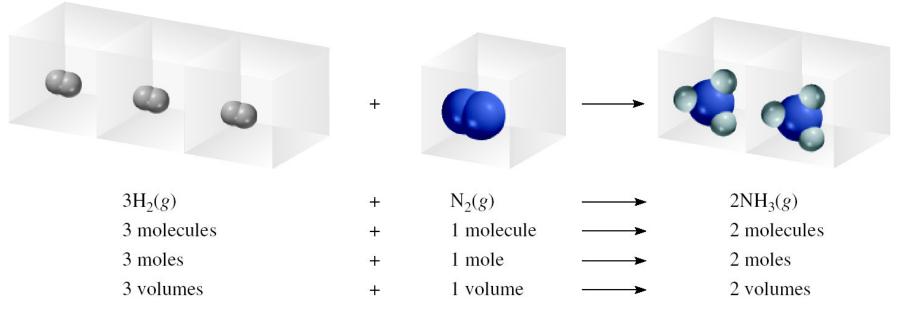

$$T_{1} = 125 (^{0}\text{C}) + 273.15 (\text{K}) = 398.15 \text{ K}$$

$$T_{2} = \frac{V_{2} \times T_{1}}{V_{1}} = \frac{1.54 \text{ L} \times 398.15 \text{ K}}{3.20 \text{ L}} = 192 \text{ K}$$

Avogadro's Law

- $V\alpha$ number of moles (*n*)
- $V = \text{constant } \mathbf{x} \ n$
 - $V_1 / n_1 = V_2 / n_2$

Constant temperature Constant pressure

Ammonia burns in oxygen to form nitric oxide (NO) and water vapor. How many volumes of NO are obtained from one volume of ammonia at the same temperature and pressure?

$$4NH_3 + 5O_2 \longrightarrow 4NO + 6H_2O$$

1 mole $NH_3 \rightarrow 1$ mole NO

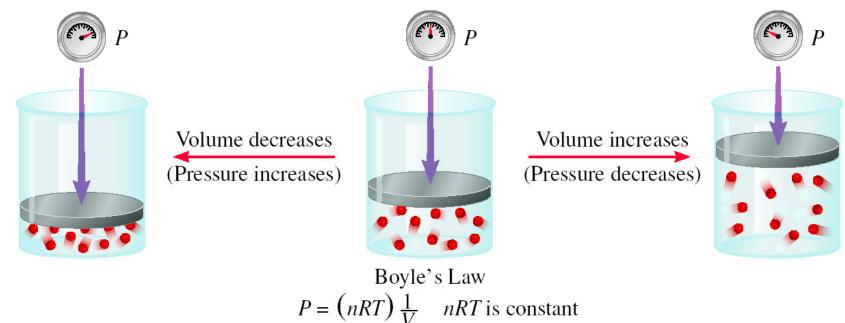

At constant T and P

1 volume $NH_3 \rightarrow 1$ volume NO

Summary of Gas Laws

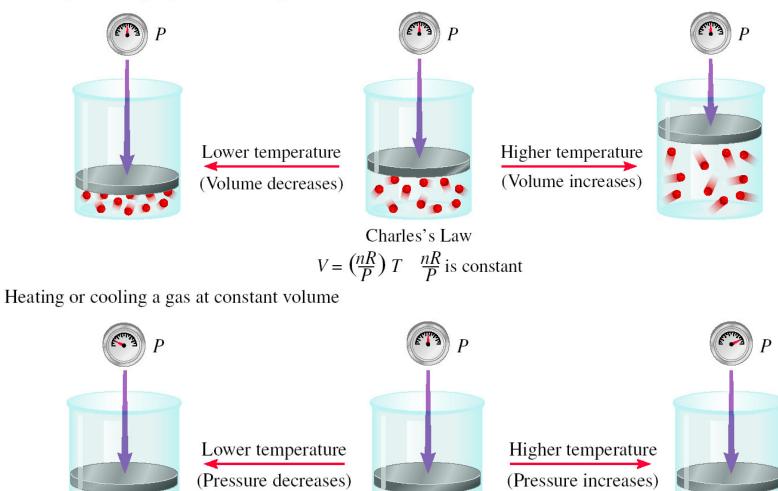

Boyle's Law

Increasing or decreasing the volume of a gas at a constant temperature

Charles Law

Heating or cooling a gas at constant pressure

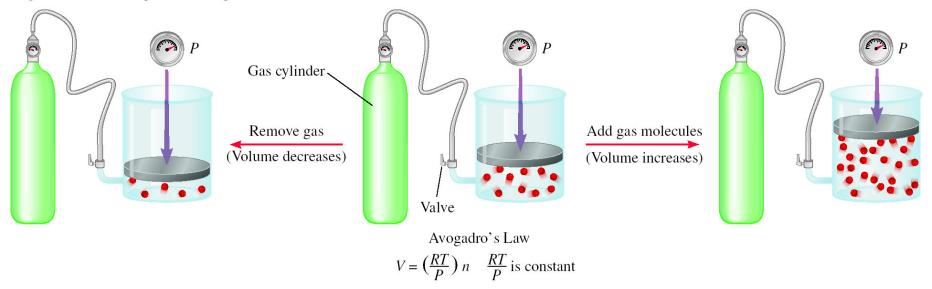

Charles's Law

 $P = \left(\frac{nR}{V}\right)T \quad \frac{nR}{V}$ is constant

17

Avogadro's Law

Dependence of volume on amount of gas at constant temperature and pressure

Ideal Gas Equation Boyle's law: $P \alpha \frac{1}{V}$ (at constant *n* and *T*) Charles' law: $V \alpha T$ (at constant *n* and *P*) Avogadro's law: $V \alpha n$ (at constant *P* and *T*)

$$V \alpha \frac{nT}{P}$$

 $V = \text{constant } x \frac{nT}{P} = R \frac{nT}{P}$ R is the **gas constant**
 $PV = nRT$

The conditions 0 °C and 1 atm are called **standard temperature and pressure (STP).**

Experiments show that at STP, 1 mole of an ideal gas occupies 22.414 L.

PV = nRT $R = \frac{PV}{nT} = \frac{(1 \text{ atm})(22.414\text{L})}{(1 \text{ mol})(273.15 \text{ K})}$

 $R = 0.082057 \text{ L} \cdot \text{atm} / (\text{mol} \cdot \text{K})$

What is the volume (in liters) occupied by 49.8 g of HCl at STP?

 $T = 0 \ {}^{\circ}\text{C} = 273.15 \text{ K}$ P = 1 atm P = 1 atm $N = \frac{nRT}{P}$ $n = 49.8 \text{ g x} \frac{1 \text{ mol HCl}}{36.45 \text{ g HCl}} = 1.37 \text{ mol}$ $V = \frac{1.37 \text{ mol x } 0.0821 \frac{1 \text{ atm}}{\text{mol x }} \text{ x } 273.15 \text{ K}}{1 \text{ atm}}$

V = 30.7 L

Argon is an inert gas used in lightbulbs to retard the vaporization of the filament. A certain lightbulb containing argon at 1.20 atm and 18 °C is heated to 85 °C at constant volume. What is the final pressure of argon in the lightbulb (in atm)?

 $PV = nRT \quad n, V \text{ and } R \text{ are constant}$ $\frac{nR}{V} = \frac{P}{T} = \text{constant} \qquad P_1 = 1.20 \text{ atm} \qquad P_2 = ?$ $T_1 = 291 \text{ K} \qquad T_2 = 358 \text{ K}$ $\frac{P_1}{T_1} = \frac{P_2}{T_2}$ $P_2 = P_1 \times \frac{T_2}{T_1} = 1.20 \text{ atm} \times \frac{358 \text{ K}}{291 \text{ K}} = 1.48 \text{ atm}$

Density (d) Calculations

$$d = \frac{m}{V} = \frac{P\mathcal{M}}{RT}$$

m is the mass of the gas in g \mathcal{M} is the molar mass of the gas

<u>Molar Mass (\mathcal{M}) of a Gaseous Substance</u>

d is the density of the gas in g/L

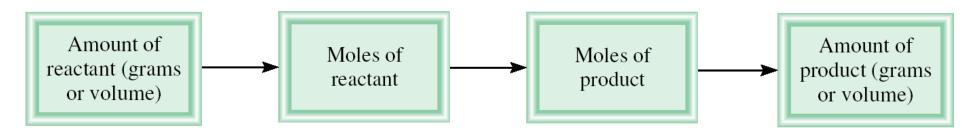

A 2.10-L vessel contains 4.65 g of a gas at 1.00 atm and 27.0 ^oC. What is the molar mass of the gas?

$$\mathcal{M} = \frac{dRT}{P} \qquad \qquad d = \frac{m}{V} = \frac{4.65 \text{ g}}{2.10 \text{ L}} = 2.21 \frac{\text{g}}{\text{L}}$$

$$\frac{2.21 \frac{\text{g}}{\text{L}} \times 0.0821 \frac{\text{L} \cdot \text{atm}}{\text{mol} \cdot \text{K}} \times 300.15 \text{ K}}{1 \text{ atm}}$$

 \mathcal{M} = 54.5 g/mol

Gas Stoichiometry

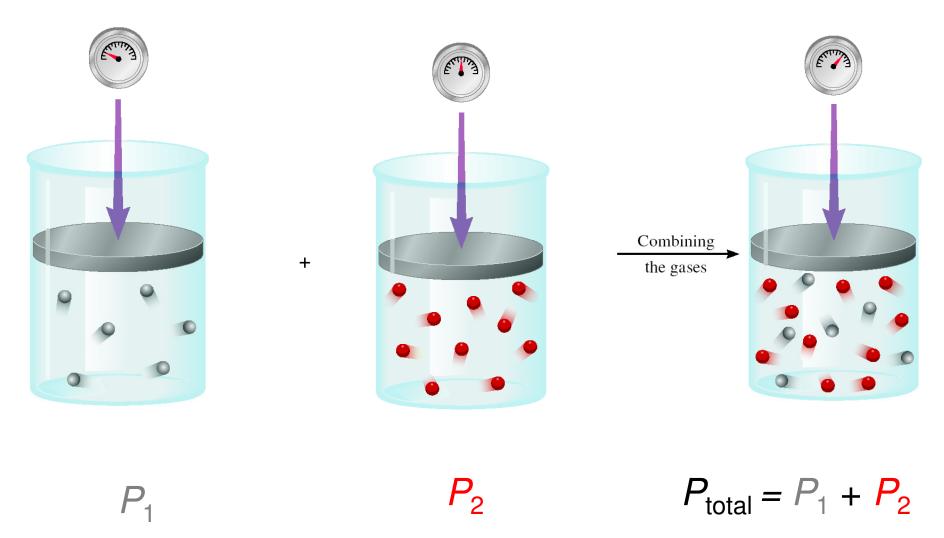

What is the volume of CO_2 produced at 37 °C and 1.00 atm when 5.60 g of glucose are used up in the reaction:

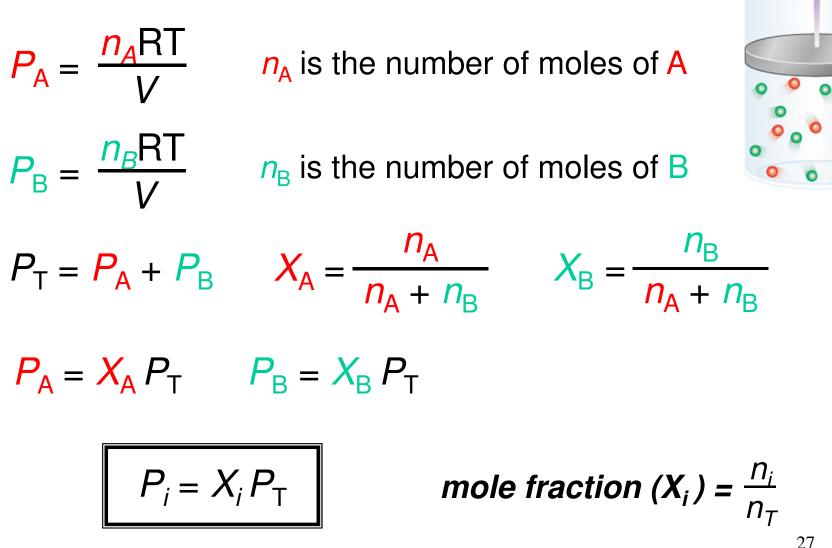

$$C_6H_{12}O_6(s) + 6O_2(g) \longrightarrow 6CO_2(g) + 6H_2O(l)$$

 $g C_{6}H_{12}O_{6} \longrightarrow \text{mol } C_{6}H_{12}O_{6} \longrightarrow \text{mol } CO_{2} \longrightarrow V CO_{2}$ 5.60 g C_{6}H_{12}O_{6} × $\frac{1 \text{ mol } C_{6}H_{12}O_{6}}{180 \text{ g } C_{6}H_{12}O_{6}}$ × $\frac{6 \text{ mol } CO_{2}}{1 \text{ mol } C_{6}H_{12}O_{6}}$ = 0.187 mol CO₂ $V = \frac{nRT}{P} = \frac{0.187 \text{ mol } \times 0.0821 \frac{\text{L} \cdot \text{atm}}{\text{mol } \cdot \text{k}} \times 310.15 \text{ k}}{1.00 \text{ atm}} = 4.76 \text{ L}$ 25

Dalton's Law of Partial Pressures V and T are constant

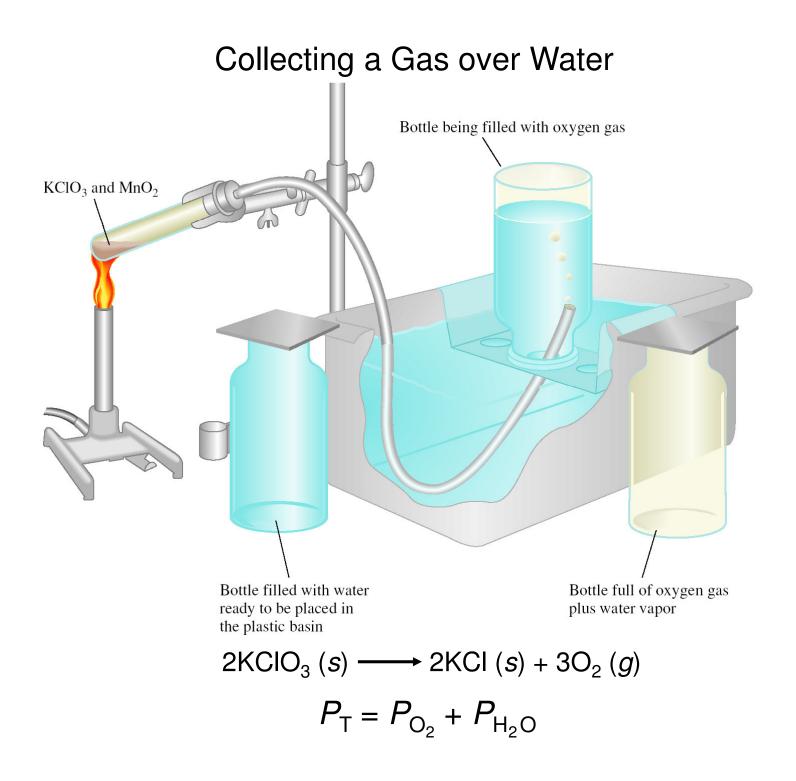

Consider a case in which two gases, A and B, are in a container of volume V.

A sample of natural gas contains 8.24 moles of CH_4 , 0.421 moles of C_2H_6 , and 0.116 moles of C_3H_8 . If the total pressure of the gases is 1.37 atm, what is the partial pressure of propane (C_3H_8)?

$$P_i = X_i P_T$$
 $P_T = 1.37$ atm
 $X_{\text{propane}} = \frac{0.116}{8.24 + 0.421 + 0.116} = 0.0132$
 $P_{\text{propane}} = 0.0132 \times 1.37$ atm = 0.0181 atm

Kinetic Molecular Theory of Gases

- A gas is composed of molecules that are separated from each other by distances far greater than their own dimensions. The molecules can be considered to be *points*; that is, they possess mass but have negligible volume.
- 2. Gas molecules are in constant motion in random directions, and they frequently collide with one another. Collisions among molecules are perfectly elastic.
- 3. Gas molecules exert neither attractive nor repulsive forces on one another.
- The average kinetic energy of the molecules is proportional to the temperature of the gas in kelvins. Any two gases at the same temperature will have the same average kinetic energy

$$\overline{\mathsf{KE}} = \frac{1}{2} m \overline{u^2}$$

Kinetic theory of gases and ...

Collision rate α average kinetic energy of gas molecules

Average kinetic energy α T

 $P \alpha T$

Kinetic theory of gases and ...

• Avogadro's Law

 $P \alpha$ collision rate with wall Collision rate α number density Number density α *n* $P \alpha$ *n*

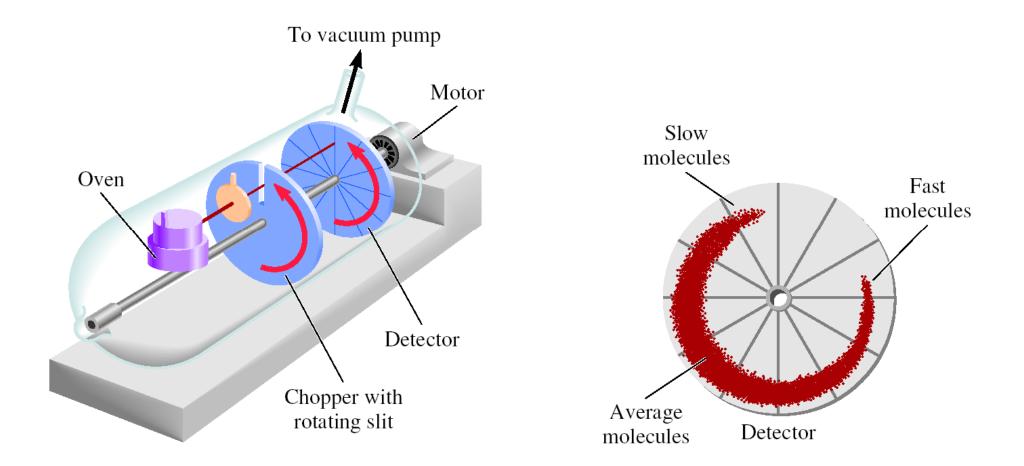

• Dalton's Law of Partial Pressures

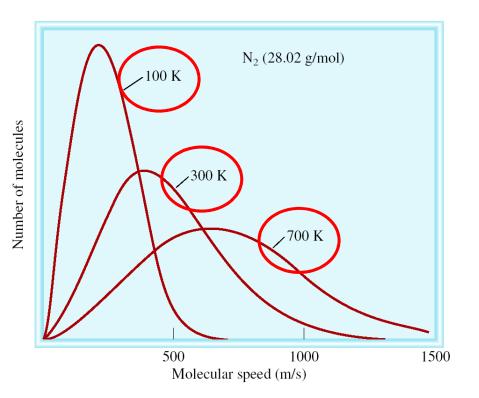

Molecules do not attract or repel one another

P exerted by one type of molecule is unaffected by the presence of another gas

 $P_{\text{total}} = \Sigma P_{\text{i}}$

Apparatus for Studying Molecular Speed Distributiona

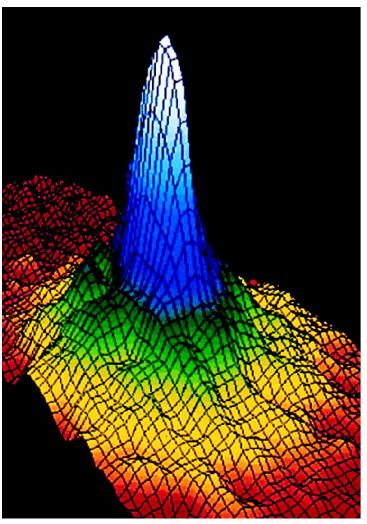

The distribution of speeds of three different gases at the same temperature

Set the probability of the prob

The distribution of speeds for nitrogen gas molecules at three different temperatures

$$u_{\rm rms} = \sqrt{\frac{3RT}{\mathcal{M}}}$$

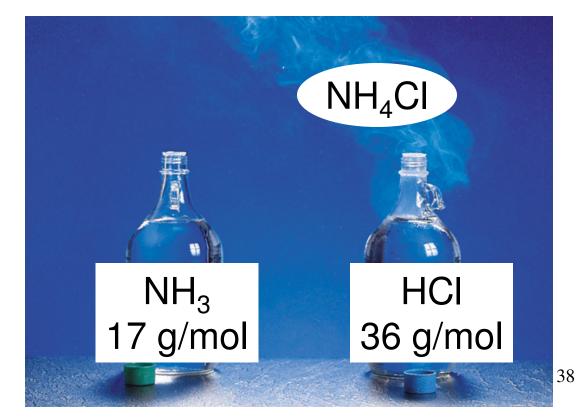

Chemistry in Action: Super Cold Atoms

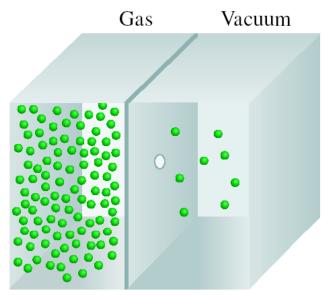

Maxwell velocity distribution of Rb atoms at about 1.7 x 10⁻⁷ K Bose-Einstein condensate (BEC) 37 **Gas diffusion** is the gradual mixing of molecules of one gas with molecules of another by virtue of their kinetic properties.

 r_2

molecular path

Gas effusion is the is the process by which gas under pressure escapes from one compartment of a container to another by passing through a small opening.

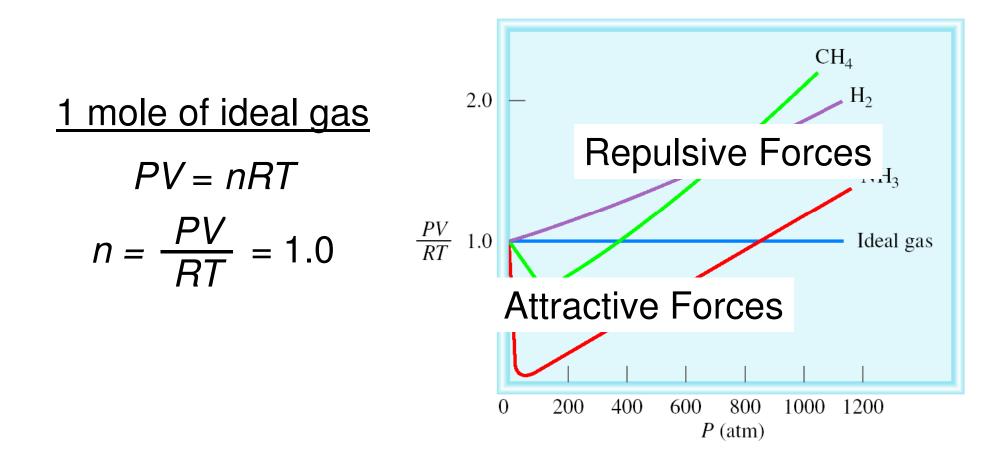

$$\frac{\mathbf{r}_1}{\mathbf{r}_2} = \frac{\mathbf{t}_2}{\mathbf{t}_1} = \sqrt{\frac{\mathcal{M}_2}{\mathcal{M}_1}}$$

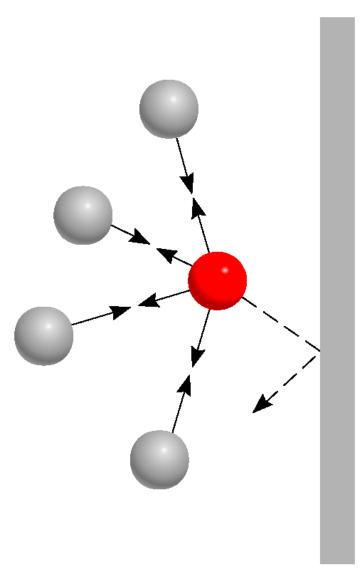

Nickel forms a gaseous compound of the formula $Ni(CO)_x$ What is the value of x given that under the same conditions methane (CH₄) effuses 3.3 times faster than the compound?

$$r_{1} = 3.3 \text{ x } r_{2} \qquad \qquad \mathcal{M}_{2} = \left(\frac{r_{1}}{r_{2}}\right)^{2} \text{ x } \mathcal{M}_{1} = (3.3)^{2} \text{ x } 16 = 174.2$$
$$\mathcal{M}_{1} = 16 \text{ g/mol} \qquad \qquad 58.7 + x \cdot 28 = 174.2 \qquad x = 4.1 \sim 4_{39}$$

Deviations from Ideal Behavior

Effect of intermolecular forces on the pressure exerted by a gas.

Van der Waals equation nonideal gas

$$\left(P + \frac{an^2}{V^2}\right)(V - nb) = nRT$$

corrected pressure

corrected volume
