

Effectiveness of educational program on moral distress among Jordanian psychiatric nurses

Shaher H Hamaideh, PhD, RN
Faculty of Nursing/The Hashemite University/Jordan

Abstract

Background and purpose: Moral distress has received much attention in nursing literature. This study aimed to conduct and evaluate the effectiveness of a workshop .on moral distress level among psychiatric nurses in Jordan

Methods: The study was conducted in the two largest public psychiatric hospitals. All nurses in the selected hospitals were invited to participate in the study. The final sample consisted of 105 nurses who assigned randomly to either interventional or control group. A pretest-posttest control group design was employed. All participants in both groups completed Moral Distress Scale for Psychiatric nurses (MDS-P) before the workshop, and 3 months after the workshop. The intervention group received the workshop while the control group did not. The workshop consisted of case studies and discussions of distressing situations in psychiatric hospitals; discussions of signs, symptoms, and causes of moral distress; and formulation of strategies to deal with .moral distress

Results: Results showed significant differences in moral distress levels between pretest and posttest measures for the interventional group ($t=5.05$, $p< 0.000$) indicating that the workshop significantly reduced the level of moral distress among .psychiatric nurses

Conclusions: Further workshops to other psychiatric nurses in other settings as well .as for control group nurses are required to be conducted

Biography

Shaher Hamaideh has completed his PhD in 2004 from University of Cincinnati, Ohio, USA. He is the Associate dean at Faculty of Nursing at the Hashemite University, Jordan. He has published more than 25 papers in reputed journals and has .been serving as an editorial board member in international nursing journal. of repute
